TITLE:

On the Statistical Theory of the Scale Factor (K statisticheskoy teorii masshtabnego faktora)

PERIODICAL:

Zhurnal tekhnicheskoy fiziki, Vol 28, Nr 10, pp 2260-2261 (USSR)

ABSTRACT:

The influence of the dimensions of a body upon its critical rupture stress can satisfactorily be explained only from a statistical viewpoint (Refs 1,2). In this letter to the editor one of the variants of the theory of the scale factor is advanced. This variant-is based upon a utilization of the analysis of random steady functions. Formula (6) for the stress in the cross section is derived. This formula specifies the critical rupture stress versus length of the sample function. The curve obtained by means of this formula differs only insignificantly from that presented in reference 3. There are 1 figure and 3 references, 2 of which are Soviet.

and 1957 at the Tsentral'nyy nauchno-issledovatel'skiy intitut stroitel'nykh konstruktsiy, ASIA SSSR (Central Scientific Research Institute of Structures, Academy of Building and Architecture, USSR). This collection of articles is the fourth of a series written by staff members of the Laboratory for Problems of Strength and the Laboratory of Structural Mechanics of TsNIISK. References follow most of the articles.

TABLE OF CONTENTS:

Foreword

3

Rzhanitsyn, A.R. [Corresponding Member, Academy of Building and Architecture, USSR, Doctor of Technical Sciences, Professor]. Design of Shells by the Method of Limit Equilibrium 7 As a base for his investigation, the author uses the simplified kinematic method for analysis of elastoplastic systems, which takes the effect of strain hardening and nonlinear deformation into account. He presents a number of solutions for the state of failure of thin-walled structures, such as thin plates and slightly curved and cylindrical shells. Use of this method for the design of reinforced concrete shells is also explained.

Card 2/6

Investigating of Problems (Cont.)

SOV/2165

Rzhanitsyn, A.R. Problem of Creep From Temperature and Humidity Effect

36

The author discusses a method of calculating creep caused by changes of temperature and humidity. The method includes the use of a variable scale of conditional time. The scale varies with temperature and humidity, while the properties of creep are not affected. This method solves the problem of calculating creep of a stretched bar during periodical wide-range temperature changes and the problem of calculating stresses generated during the drying of a rigidly fastened thin plate or film. This method is also satisfactory for solving creep problems in green concrete during setting time.

Rzhanitsyn, A.R. Limit Equilibrium of a Rectangular Plate Under a Concentrated Load Applied at an Arbitrary Point 50 The author discusses types of plate failure occurring at various positions of concentrated load.

Rzhanitsyn, A.R. The Problem of Movement of Elasto-plastic Beams and Plates Loaded Beyond the Limit of Their Carrying Capacity 62 Card 3/6

sov/2165

The article discusses sudden loading, during which the movement of a beam does not change in time. Also discussed is an extremal principle for determining the true form of movement of a beam or a plate under steady loading exceeding the carrying capacity of the structure.

Geniyev, G.A. [Candidate of Technical Sciences]. Some Problems of the Propagation of Compression Waves in Soil

The theory of the propagation of compression shock waves in ideally loose compressible soil is discussed. Calculations based on this theory are useful for determining pressure on underground structures during surface blast loading.

Geniyev, G.A. Some Problems in the Dynamics of Visco-plastic
Media
Differential equations for plane steady motion of a viscoplastic medium are derived, and an approximate method for
their solution is discussed.

Geniyev, G.A. Problem of Strength of Concrete

A relatively simple analytical expression for the strength
of concrete is presented showing the behavior of concrete at

compression and tension and giving results which agree with experimental data.

Estrin, M.I. [Candidate of Technical Sciences]. Theory of the Unsteady Motion of a Perfectly Plastic Body
Some problems of the dynamics of a perfectly plastic body under conditions of plane deformation are discussed.

Estrin, M.I. Design of Elastic Systems for Stationary Random Ef155
fects

The problem of the effect of occasional

The author analyzes the problem of the effect of occasional stationary loads (wind, temperature) on the elastic and non-linearly elastic systems by using the theory of stationary random functions. Formulas for relatively simple calculation of numerical mean values of displacements and deflections are derived.

Mileykovskiy, I.E. [Candidate of Technical Sciences]. Design of Massive Plates by the Variational Method Using Resolvent Functions for Displacements

Card 5/6

Investigating of Problems (Cont.)

sov/2165

The author reduces the three thermoelastic DuHamel-Neumann equations to one equivalent polyharmonic resolvent equation of the sixth order (for each resolvent function) and uses the variational method to reduce the three-dimensional problem to a two-dimensional one. The application of resolvent functions to the problem of designing thick plates is shown.

TITLE: Calculation of Cylindrical Shells Clamped on an Inclined Contour (Raschet tsilindricheskoy obolochki, zakreplennoy po kosomu konturu)

PERIODICAL: Izvestiya Akademii nauk SSSR OTN, Mekhanika i mashinostroyeniye, 1959, Nr 2, pp 151-155 (USSR)

ABSTRACT: The paper deals with an approximate method of solving the problem of a cylindrical shell in which the boundary conditions are given along a contour defined by the intersection of the shell with a plane inclined to its axis. Such shells are often encountered as duct elements, gasholders, aerodynamic tubes, etc. Following Vlasov (Ref 1) and Gol'denveyzer (Ref 2), the differential equations for the shell are set up and solved approximately for a clamped

TITLE:

The Equations of the Dynamics of a Compressible Plastic Medium

PERIODICAL:

Doklady Akademii nauk SSSR, 1960, Vol. 135, No. 1, pp.36-39

TEXT: The author of the present paper investigates an approximative variant of equations describing the two-dimensional motion of a plastic medium; other variants were investigated in Refs. 1-3. The system of equations describing the state of the medium consists of: plasticity condition

 $(\sigma_{x} - \sigma_{y})^{2} + 4\tau_{xy}^{2} = 4k^{2}, \text{ coaxiality condition}$ $\frac{2\tau_{xy}}{\sigma_{x}^{-\sigma_{y}}} = \frac{\hat{\gamma}_{xy} - \hat{\tau}_{xy}/G}{\hat{\epsilon}_{x}^{-\hat{\epsilon}_{y}} - (\hat{\sigma}_{x}^{-\hat{\sigma}_{y}})/2G}, \text{ and the incompressibility condition}$

 $\dot{\epsilon}_{x}$ + $\dot{\epsilon}_{y}$ = 0. Instead of the latter it is possible, because a two-dimensional problem is being investigated, to use the condition $\mathring{\epsilon}_x$ + $\mathring{\epsilon}_y$ $=\frac{1}{2K}(\mathring{\sigma}_x + \mathring{\sigma}_y)$. The motion of the medium is described by the system

84658

The Equations of the Dynamics of a Compressible S/020/60/135/001/009/030 Plastic Medium S/020/60/135/001/009/030

 $\frac{\partial \chi}{\partial x} - 2 \sin \varphi \frac{\partial \varphi}{\partial x} + \cos 2\varphi \frac{\partial \varphi}{\partial y} - \frac{\mathbf{o}}{2k} \frac{\partial \mathbf{u}}{\partial t} = 0; \frac{\partial \chi}{\partial y} + \cos 2\varphi \frac{\partial \varphi}{\partial x} + \sin 2\varphi \frac{\partial \varphi}{\partial y} - \frac{\mathbf{o}}{2k} \frac{\partial \mathbf{v}}{\partial t}$ $= 0; h \frac{\partial \chi}{\partial t} - \frac{\partial \mathbf{u}}{\partial x} - \frac{\partial \mathbf{v}}{\partial y} = 0; h, \frac{\partial \varphi}{\partial t} + \sin 2\varphi (\frac{\partial \mathbf{u}}{\partial x} - \frac{\partial \mathbf{v}}{\partial y}) - \cos 2\varphi (\frac{\partial \mathbf{u}}{\partial y} + \frac{\partial \mathbf{v}}{\partial x}) = 0;$

Q - density, h = 2k/K, h₁ = 2k/G; σ_{x} , σ_{y} , τ_{xy} - the components of the stress tensor, ϵ_{x} , ϵ_{y} , γ_{xy} - the components of the deformation tensor, u, v - the velocity components. Using these equations, the propagation of a weak discontinuity and the behavior of the wave fronts is investigated. A problem outlined in Fig. 2 is briefly discussed, and finally the special case is investigated, in which h₁ = 0 and therefore, according to equation (5) for the propagation rate of a weak discontinuity it holds

that this rate $D = c_1 \cos 2$ ($\gamma - \alpha$) ($c_1 = \sqrt{2k/\varrho k_1}$, $\alpha = \gamma - \gamma$). The author investigated the self-simulating motion of the medium and gives a geometrical interpretation of the result. G. A. Geniyev is mentioned. There are 3 figures and 5 references: 4 Soviet and 1 US.

AUTHOR: Estrin. M. J. (Moscow)

TITLE: On the Application of the Self-Modeling Solutions to Dynamic Problems of a Plastic Medium

PERIODICAL: Prikladnaya matematika i mekhanika, 1960, Vol. 24, No.6, pp. 1140-1142

TEXT: The author considers the system of equations which describes the instationary motion of an ideal plastic medium under plane deformation. In this system the stresses are expressed by two unknown functions χ and φ according to the formulas

$$\begin{bmatrix} \sigma_x \\ \sigma_y \end{bmatrix} = k(2)^{\frac{1}{2}} \cos 2\varphi$$
, $\sigma_{xy} = k \sin 2\varphi$.

After introducing nondimensional variables (especially nondimensional time T=t/t) the author obtains a system which passes over into the equations of the self-modeling motions for $t\to\infty$ (see(Ref.6)). In order to obtain approximative solutions corresponding to large t-values, the author sets up the unknown functions χ , φ , u, v as series in τ

88769

S/040/60/024/006/024/024 C 111/ C 333

On the Application of the Self-Modeling Solutions to Dynamic Problems of a Plastic Medium

(4)
$$\chi = \chi^{(0)} + \tau \chi^{(1)} + \dots, \quad u = u^{(0)} + \overline{c}u^{(1)} + \dots$$

 $\psi = \psi^{(0)} + \overline{c}\psi^{(1)} + \dots, \quad v = v^{(0)} + \overline{c}v^{(1)} + \dots$

By substituting (4) into the equations of motion, the author obtains systems of equations for determining $\chi^{(0)}$, $\chi^{(1)}$,... etc. The zero approximation ($\chi^{(0)}$, $\varphi^{(0)}$, $u^{(0)}$, $v^{(0)}$ corresponds to the self-modeling solution. For the first approximation one obtains a hyperbolic system with the characteristics

(7)
$$\frac{d\mu}{d\lambda} = tg(\varphi^{(0)} + \frac{\pi}{4})$$

where $\lambda = \frac{x}{at}$, $\omega = \frac{y}{at}$ (a = $\frac{2k}{g}$) are the nondimensional spatial coordinates. For the numerical solution of the system the author refers to the difference method (Ref.6).

TOPIC TAGS: fiberglass, dight scattering glass, vacuum.		P 4
ABSTRACT: This Author Certificate presents a method for fusing fiber packets by compressing the packet (situated in a softened glass sheath) in vacuum. To obtain light-transmitting packets of high resolution and large dimensions, the external pressure on the packets is produced by compressed air via a heated glass sheath softened by application of heat. To obtain phocons of axial symmetry, the circular uniform pressure is realized by means of a gas, while those regions where the specimen is not to be compressed are protected by high-melting glass rings.		\$ 1 at

TITLE: Application of vortex effect in chemical engineering

SOURCE: Khimicheskaya promyshlennost, no. 4, 1963, 32-36

TOPIC TAGS: vortex effect, vortex tube

ABSTRACT: A survey of what has been done up to now with respect to the application of the vortex effect in chemical engineering. Authors define vortex effect as the division of gas into cold and hot flows during its expansion in the vortex tube. Various types of vortex tubes are discussed. Authors made a number of tests wherein they checked the characteristics of a vortex tube at different pressures under production-line conditions. This tube had a 40 mm diameter, two right-angled nozzles with spiral inlets. Interchangeable diaphragms of 18, 20, and 22 mm were used. The gas temperature at the inlet was 34-40C. Gas expenditure was 840-460 normal cubic meters per hour. The results are summarized in graphs which are discussed in detail. Treatment is

TITLE: Synthesis of methylchlorosilanes in a fluidized bed with the use of vibration

SOURCE: Khimicheskaya promyshlennost, no. 6, 1965, 468-470

TOPIC TAGS: organosilicon compound, vibration, fluidized bed, chlorosilane synthesis, silicon powder, copper powder

ABSTRACT: Experiments involving powdered silicon-copper alloys and also mixtures of silicon and copper powder were carried out in order to determine the hydrodynamic characteristics of a fluidized bed with the use of vibration. The latter reduces the critical rate of fluidization w_k by a factor of 1.5-2, and the critical rate in the presence of vibration, w_k , decreases with the diameter of the tube in which the process takes place. Optimum conditions of the process were determined (lowest critical rate of fluidization, $w_k = 0.35$ cm/sec, for 75-100 μ particles and a tube diameter of 40 mm). On the basis of the data obtained, a synthesis of methylchlorosilanes was carried out with various silicon-copper contact masses, using methyl chloride. The composition of

Card 1/2

L 58961-65

ACCESSION NR: AP5016375

the mixture of methylchlorosilanes produced was determined by gas-liquid chromatography with a KhL-3 instrument. The process was very reproducible when vibration was employed. The conversion of methyl chloride reached 35-55%, as compared to 5-10% in synthesis with a fluidized bed without vibration. Owing to a good mass and heat exchange, even at low linear gas flow rates, the reproducibility and content of dimethylchlorosilane are very satisfactory. Orig. art. has: 5 figures and 1 table.

: Dependence of ionization current on energy of gamma-radiation

Periodical

: Zhur. eksp. i teor. fiz., 24, 221-228, Feb 1952

Abstract

: Studies the ionization currents from gamma-rays in air filled chambers with walls of lead and carbon as a function of gamma-ray energy. Found the sensitivity of slit ionization chambers of carbon and lead to gamma rays within the energy range of 0.3 to 3 MeV. Indebted to Prof. I. M. Frank and M. V. Klimentovskaya. 24 references, including 18 foreign.

Isomeric conversions of In115*, In113* ard Sr87*

Periodical : Izv. AN SSSR. ser. fiz. 18/1, 79-87, Jan-Feb 1954

* The isomeric conversions of In^{115*} , In^{113*} and Sr^{87*} were investigated by the ionization method and the relative conversion energies and semi-decomposition period of these isotopes were established. A comparison of experimental and theoretical data made it possible to determine the multi-polarity of these isomeric conversions. It was established that all such radiation (gamma-radiation) conversions are electrical 25-polar conversions. The coefficients of internal conversion of gamma rays in Inl13*, Inl15* and Sr87* were determined with an accuracy of 10-15%. Data regarding the odd numbers of neutrons or protons in the nuclei of Sr87, Inl13 and Inl15 are included. Twenty-four

Title

Measurement of the coefficients of internal conversion by gamma rays of

Sr-87*, In-113*, and V-51* in electrons of atoms

Periodical:

Zhur. eksp. i teor, fiz. 28, 541-546, May 1955

Abstract

The authors determine the complete coefficients of internal conversion by gamma rays of Sr-87*, In-113*, In-115* and V-51* in electrons of atoms by way of direct measurements of the number of electrons and gamma quanta radiated by the source. The corresponding values found 0.26\$0.03, 0.39\$0.0\$4, 0.9\$0.6, and (3.1\$0.2)*10-3 lead to a conclusion concerning the energy 25-pole radiational transition of Sr-87*, In-113* and In-115* and the electric quadrupole transition of V-51*. Orig Pub : Zh. eksperim. i teor. fiziki, 1956, 30, No 3, 579-580

Abstract : A narrow beam of thermal neutrons, filtered by graphite, with an average kinetic energy of 0.026 ev, was collimated by two foils of cadmium with slit apertures 2 mm wide, placed 50 cm apart. Two aluminum plates were placed in parallel with the planes of the slits. The plates were 50 cm long, and the distance between them was 7.5 mm. The difference of potential between the plates was 10 kv. If the neutron charge is qe, where e is the electron charge, then the electric field of the capacitor should deflect the beam by $\Delta x = \text{qeEl}^2/4w$, where E is the electric field intensity and W the kinetic energy of the neutrons. The experimentally observed displacement of the beam was less than 0.02 mm, corresponding to q less than 6×10^{-12} .

Title : Polarization - Direction Correlation of Successive Gamma Quanta

From Co60 and Na24.

Orig Pub : Zh. eksperim. i teor. fiziki, 1956, 30, No 6, 1052-1057

Abstract : Description of apparatus for measuring the polarization-direction

correlation of gamma quanta emitted in cascade. This apparatus, the polarization sensitivity of which was first determined experimentally, was used to perform measurements on gamma quanta from ${\rm Co}^{60}$ and ${\rm Na}^{24}$. The even parity of the first two excited states of ${\rm Ni}^{60}$ and ${\rm Mg}^{24}$ was

proven.

AUTHOR TITLE

ESTULIN, I.V., KALINKIN, L.F., MELIORANSKIJ, A.S.

The Gamma Quanta emitted by the Nuclei of J. Rh amd Co on the

gccasion of the Capture of Thermal Neutrons. Zurn.eksp.i teor.fis,31,fasc.5, 886-887 (1956)

Issued: 1 / 1957

The present work determines the energies and absolute intensities of the & -quanta mentioned in the title with from 50 to 600 keV. For this purpose a luminescence spectrometer with a cylinder-shaped NAJ(T1)-crystal (height 9 mm, diameter 28 mm) was used. As a source of thermal neutrons a physical test reactor with heavy water was used. From the horizontal channel in the shield of the reactor a well-collimated neutron bundle emerged, and in the center of the bundle the target made of the substance to be investigated was located. Under the target there was a NaJ(T1)-crystal with a photoelectric amplifier. On the occasion of the measuring of the f-rays produced on the occasion of neutron capture, the measuring results obtained in the case of an opened bundle of thermal neutrons (N) were compared with those obtained when the output of the neutron collimator was covered by means of a lid of $B_4C(N_1)$. The effect (N) produced by the thermal neutrons on the target is equal 4 to the difference of these two results: N = N -N1. In the spectra of the investigated targets the photopeaks of soft &-quanta (emitted by the nuclei on the occasion of the capture of thermal neutrons) rise above the background of the momenta originating from harder / -gamma quanta.

Zurn.eksp.i teor.fis, 31, fasc.5, 886-887 (1956) CARD 2 / 2 PA - 1786 On the occasion of the capture of thermal neutrons by iodide nuclei, 7 -quanta with E = 135 + 4 keV were noticed which had escaped the attention of other authors. The results of such a test are shown in form of a diagram in which the photopeak caused by / -quanta with 135 keV is distinctly visible. The intensity of these gamma quanta is n = 30 per 100 captures of thermal neutrons. Other much smaller peaks are due to the apparatus. On the occasion of the capture of thermal neutrons by Rh nuclei 4 discrete lines with the energies $E_1 = 217 \pm 4$; $E_2 = 176 \pm 4$; $E_3 = 133 \pm 4$ and $E_A = 96 \pm 4$ keV were observed. Their intensities per 100 acts of capture of thermal neutrons are $n_1 = 9.3$; $n_2 = 18$; $n_3 = 8$ and $n_4 = 16$. The latter values have an accuracy of 15-20%. The lines found can not be connected with the activation of the target because they differ as to the energy of the J-quanta of the Rh104 isomeres. The J-lines found here correspond to the transitions between these levels. On the occasion of capture of thermal neutrons by Co-nuclei, J-quanta with the energies E₁ = 276 keV and E₂ = 226 keV and with the same intensity of about 20 / -quanta per 100 captures of neutrons were noticed.

TITLE: Gamma-Spectrum Indicator

PERIODICAL: V sb.: Issied. v obl. dozimetrii ioniziruyushchikh izlucheniy. M., AS USSR, 1957, pp 166-175

ABSTRACT: The quality of a gamma spectrum is usually evaluated in a differential ionization chamber which consists of 2 coaxial cylinders. The chamber walls are made from aluminum and lead layers in such a way that the inside wall of one of the cylinders is coated with lead and that of the other cylinder with aluminum. Secondary electrons are set up in aluminum under the effect of gamma rays, chiefly by the Compton effect; in the lead, in addition, a photoelectric effect is very pronounced. Therefore, the interactions between the gamma rays and the walls of both cylinders are different, and the currents of both halves of the chamber are varied in different ways with variation of
